

ABSTRACT

A joint cover system, for covering a gap at a joint between a first body and a second body,
5 has a cover strip and a receiver strip. The cover strip had a first attachment portion and is
adapted for spanning the joint. The receiver strip has a second attachment portion and an
anchor portion. The second attachment portion is adapted to lockingly engage the first
attachment portion of the cover strip, thereby mechanically coupling the cover strip to the
receiver strip. The anchor portion extends from the receiver strip and is adapted for
10 anchoring in the first body.
